

1

Radius, area, circumference, diameter

2

A constructor must have the same name as the class

3

If something is private only the thing inside its scope can be called upon, but in public everything can be called upon

4

yes it is valid, cuz radius is assigned a value

5

Root

X

getX()

setX(int z)

factor()

Root

5 total

6

Class is broad, and sort of like a baseline

Objects are specific

9

1. Z

2. Y nad x

3. Y

4. x,z

11

Method overloading defines multiple methods in the same class that also have the same name but different parameters.

Method overriding defines a method in a subclass with the exact same signature as a method in its superclass to provide a specific implementation.

1:

```
PI = 3.14; private double radius; /** * constructor * pre: none * post: A Circle object created.  
Radius initialized to 1. */ public Circle() { radius = 1; //default radius } /** * constructor * pre: none  
* post: A Circle object created with radius r. */ public Circle(double r) { radius = r; }
```

2:

Same as the class name

3:

Public will run when code is ran, private has to be called upon

4:

Yes it is valid because both codes are in the same class

5:

A:

"Roo"

B:

x

C:

GetX

D:

SetX

E:

Calculate

F:

Roo

G:

5 members

6:

Object is an instance of a class

9:

A:

z has the "final" keyword so it will stay constant

9:

A:

z has the "final" keyword so it will stay constant

B:

y, x both are NOT final

C:

y is NOT static, so each "instance" is different

D:

x, z ARE static, this means that they are shared across the class

11:
